Product Overview

Hornady

The Hornady Lock-N-Load Headspace Gauge is a great tool for increasing the accuracy of your loaded ammunition. The Headspace gauge measures from the shoulder of the cartridge to the datum line on the cartridge case. Hornady's Lock-N-Load Bushings fit in the comparator Bushings fit the comparator with the offset and attach to calipers with a thumb screw. Can be used with bottleneck cases from 17 caliber through large bolted magnums. Ackley Improved chambers use the same bushing size as the parent case.

Notes:

- All bushing are interchangeable
- Works on all bottleneck type cases and wildcats.
- This set fits 17 caliber through bolted magnums.
- Must be used with Calipers.

Includes:

- Comparator body
- 5 bushings B-2000 Gauge
- Allen wrench

Which bushing would I use for a 6.5 PRC Or so u there on available?
Asked by Gabe1 on 2 months ago

Add your answer

Gun Reply - anonymous
According to the Hornady chart, 6.5 PRC is .425 datum, which takes the 5 bushing. .264 is the diameter of the bushing.

Without lock tool you are ...
Without the tool you are basically rebuilding blind. Hornady's Lock-N-Load Bushing system is a great field expedition offer yet has things in it. Will with a match chamber. Being that my rifle is a semi-custom Ruger Hawkeye I have the most extension of the bolt that I can.

★★★★★
Sinclair's are steel and beveled and work better
Sinclair's uses these but I didn't see how when dealing with 0.001". The Sinclair's are so much better so they are steel instead of aluminum and are beveled so they don't scratch the shoulder. Hornady's Sinclair gauges to measure a thousandth of an inch shoulder bushing.

★★★★★
Good product.
This is a must for hand loading rifle brass. This gauge allows you to know brass headspace after full sizing otherwise you're just guessing. Excessive headspace can rapture brass or worse.

Why did I wait so long to buy and use this tool?
Hornady's Lock-N-Load Bushing Set is a game changer. I was ashamed it took me a couple of years to realize this is a very important tool to check your final brass to determine how much headspace (distance between the shoulder of the cartridge and your chamber) is left. "Now" I measure my fired brass with this easy-to-use "comparator" type tool mounted to my digital caliper, and then I decide what to do with the brass. I'm a "Hornady" enthusiast and prefer to keep ranges that have been shot once or twice in my (rifle) rights recommend this simple tool!

It's all about the details
The longer you reload, the more you realize you don't know it all yet. I knew that the resizing die mishaped the case. By using calipers, I could tell that the brass was generally longer after resizing. This tool allows you to see exactly how far the resizing die has pushed back the shoulder. Used with calipers, it measures the length of the case. Knowing the length of the case helps you to fire form, case capacity and case life, as well as proper headspace in your rifle. Generally speaking, the shoulder should be pushed back as little as possible; no more than necessary. Sad, but true. Not to measure a fired case before all adjustments are made, or the same by only using a neck sizing die, is a mistake. Sorry that you doesn't. If you are only using a neck sizing die, you do not need to use this tool.

★★★★★
Must have for accurate die setup.
Easily set up sizing die to minimum spec without overworking the shoulder. Don't know how I got along without them in the past.

★★★★★
Another excellent product from Hornady
This gauge is a must when getting a consistent setting with the resizing dies. Makes sure that your brass is being resized after resulting the dies.
